Summary of The Invention

Replace the paragraph beginning at page 1, line 13 with:

The present invention aims to eliminate the above disadvantage of the known filing folders by proposing a document filing folder with at least two flaps, which has a cover formed by two sheets, an anterior sheet and a posterior sheet, which are assembled together by a binding, one of the sheets having a flap along at least one of its lower and upper edges and another flap along its lateral edge, which can be folded ~~down~~ towards the interior of the sheet for storing the documents found in the folder, and ~~in which is characterized by the fact that~~ the documents consist of notebook pages, securely linked to the binding of the two sheets so that the pages can be stored by folding ~~them down~~ the flaps successively, one on top of the other, on the sheet and with the pages under the flaps folded towards this sheet.

Detailed Description

Replace the paragraph beginning at page 2, line 7 with:

The folder can be closed by a closing means consisting in this case of rubber band 8 which is mounted so as to slide on the dorsal side of posterior sheet 2 through two eyelets 9 ~~and which.~~ The rubber band is attached at its ends to posterior sheet 2 by two rivets 10 or by any other means for immobilization or attachment, so as to close anterior sheet 1 in folded-down position over flaps 4 to 6 by engagement of the rubber band over the two corners of the folder on the anterior sheet. Thus, for rubber bands folded parallel to flap 6, the immobilization will be brought about by a metallic anti-return pin. Of course, rubber band 8 for closing can be attached in the same manner to anterior sheet 1 and mounted so as to slide to close the folder by turning the rubber band down over the opposite corners on the dorsal side of sheet 2. The rubber band can also be attached to either of sheets 1, 2 so as to close the folder by turning the band down over the corresponding sheet along a direction essentially parallel to the binding.
